PA: Product and Presentation

Creating a space where developers can quickly find accurate, reliable answers to their coding questions. What sets it apart is the community-driven approach, where users contribute their expertise, and the platform's voting and reputation system rewards quality contributions. We hope to create a self-sustaining cycle of knowledge.

A9: Product

This artifact is important to understand what we need to change during all project,also are available all credential and command to run our image and the validations of css and html and reports of usability and accessibility.

1. Installation

Here is our final product link:

[Final Product](#)

And here the docker command to start the image:

```
docker run -d --name lbaw24141 -p 8001:80 gitlab.up.pt:5050/lbaw/lbaw2425/lbaw24141
```

2. Usage

2.1. Administration Credentials

Email	Password
admin@example.com	1234

2.2. User Credentials

Type	email	Password
basic account with some notifications	alice.santos@example.com	1234
banned user	pedro.oliveira@example.com	1234

2.3. Mailtrap Credentials

Email	Password
lbaw2024g1@gmail.com	lbaw2024t14g1

Maybe, need to log in to Google, because we signed up with Google in mailtrap website.

With that, can also try log in with google feature.

3. Application Help

- Toasts to indicate errors in some pages (e.g. user try to put more than 5 tags in one question);
- Place holders in forms to help the user understand what they have to do;
- Error messages when something unexpected occurs (e.g. trying to use the same e-mail address when registering);
- User notifications when someone comments their answer or answer their question

4. Input Validation

Frontend Validation

We display warnings if the user makes any errors. For example, during registration, if the user tries to enter an email address that has already been taken, we show an appropriate warning message.

```
<div class="form-outline mb-4">
  <label for="email" class="form-label">E-mail</label>
  <input id="email" class="form-control" type="email" name="email" value="{{ old('email') }}" required="" >
  @if ($errors->has('email'))
```

```
        <span class="text-danger small">{{ $errors->first('email') }}</span>
    @endif
</div>
```

Backend Validation

As well as using policies we also use authorize to prevent unhauthorized access. With validate, we also validate our data before inserting into db.

We have the example of creating a question:

```
public function store(Request $request)
{
    $this->authorize('create', Question::class);

    if (Auth::user()->ban) {
        return redirect()->route('home')->withErrors(['message' => 'Account banned.']);
    }

    // Validate the form input
    $request->validate([
        'title' => 'required|string|max:1000',
        'content' => 'required|string',
        'tagList' => 'max:5',
        'tagList.*' => 'distinct',
    ]);
    ...
}
```

5. Check Accessibility and Usability

- Accessibility: [Link to repository Accessibility file](#) Pontuação: 16/18
- Usability: [Link to repository Usability file](#) Pontuação: 26/28

6. HTML & CSS Validation

HTML Validation:

- [Search Question](#)
- [Notifications](#)
- [Answers](#)

CSS:

- [CSS Validation](#)

7. Revisions to the Project

During the project, we decided to add some user stories and change the priority of others,and also change some designs for our pages. The user stories added were admin manage reports and github log in.

We also needed to do some changes to ebd phase, like triggers that we need to fix and add to do some functionalities, like search users for admins and fix notification triggers.

To the Eap phase we added some modules like reports and notifications to openapi, and we also change our app in order to use bootstrap and be more organized.

Basically we did a lot of changes and improvements, in order to deliver a good final product.

We also add some changes to openapi file here:

[Openapi Changes](#)

8. Implementation Details

8.1. Libraries Used

	Font Awesome
Link	https://fontawesome.com/
Function	It is used to put the symbols of github and google in log in and register forms

	Font Awesome
Used on page	Login

	Mailtrap
Link	https://mailtrap.io/
Function	Recover password using email
Used on page	Login

	Pusher
Link	https://pusher.com/
Function	Notifications in real time
Used on page	In all pages when a notification drop

We used also githubOAUTH and googleOAUTH, to log in our app with that accounts.

8.2 User Stories

US Identifier	Name	Module	Priority	Team Members	State

A10: Presentation

This artifact corresponds to the presentation of our final product, and explain how the presentation will work.

1. Product presentation

AskIT it is basically a q&a platform, focused on sharing programming problems. The main features include search, post, answer, report, notifications, edit and vote.

Main features that will be presented:

- Log in and register with various options (e.g. github and google);
- Password recovery with mailtrap;
- Search for questions, by title or content or by tags;
- Post questions, answers to questions;
- Mark answer as correct;
- Edit question;
- Report content;
- Notifications of interacting;
- Admin search users;
- Admin manage reports and tags;
- View profile and Edit profile with supporting picture;
- Admin manage users (e.g delete, ban).

2. Video presentation
